

# Catering Combined

Many Cuisines, One Place

Owen Shepherd, Robert De Matteo

# The problem

- You are hosting an event for 30-40 people and would like to explore different cuisine options that catering companies offer.
- You do an online search and realise that all the catering companies have different websites.
- In addition catering companies offer similar types of food.
- The solution:

## Catering Combined

Many Cuisines, One Place

Many catering companies on  
the one website

Each catering company  
specializes in a cuisine type  
(e.g. Italian, German,  
Korean)

# Walk through

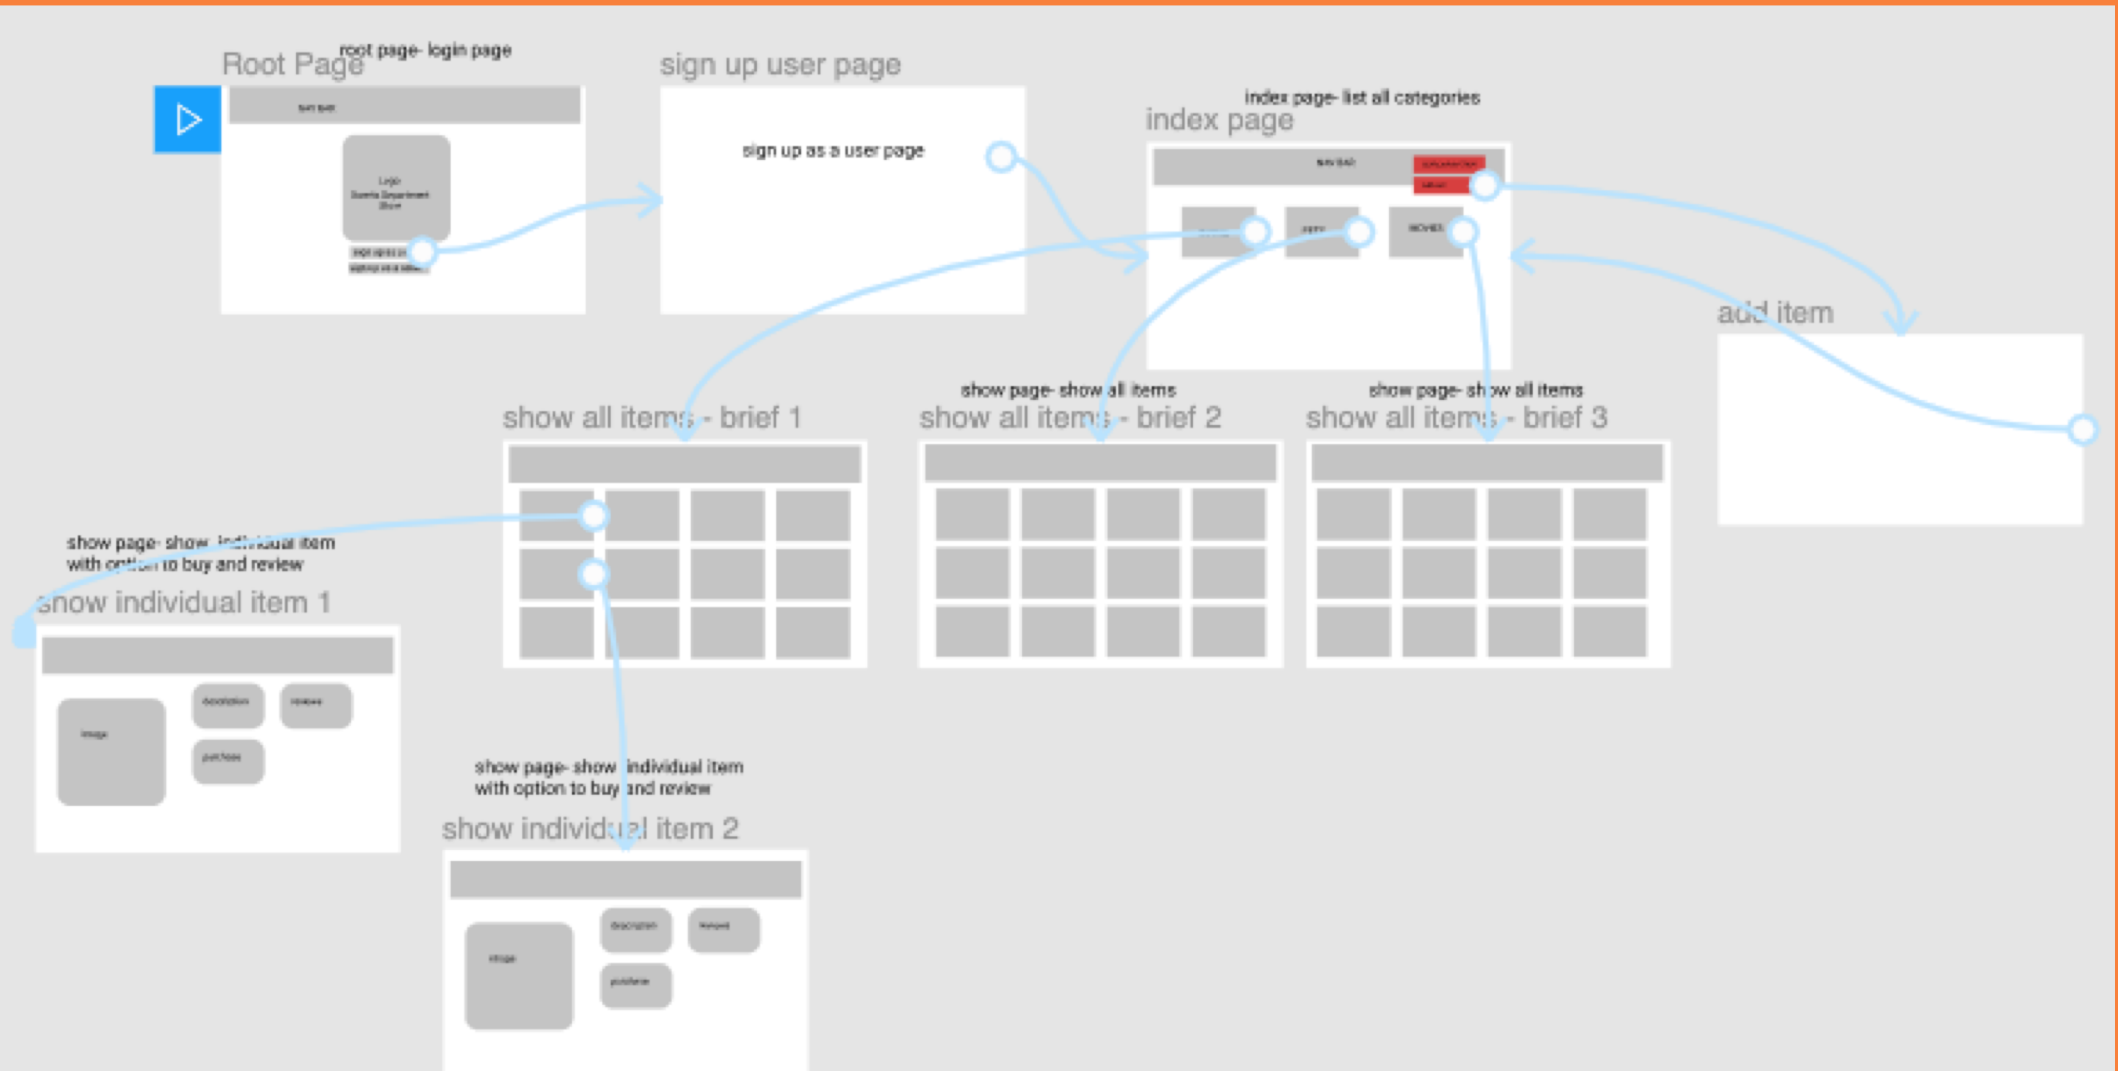

# Features

# development/build process

- Development/build process/design
  - Design was kept simplistic and as minimal as possible
  - Emphasis was placed on create a familiar and intuitive user experience
  - Some images were used to liven up certain pages (as seen in sign up pages)

- Ethical issues

- One issue that may arise within the Catering Combined application (and any two-sided marketplace application, for that matter) is the chance that users will misuse the service by either failing to provide adequate services as was advertised or not providing them entirely. These problems are largely mitigated by larger corporate marketplaces (such as eBay) through harsh disciplinary action against fraudulent users as well as fail-safes to ensure that users who are subject to malicious activity are refunded or otherwise compensated

- Favourite parts
  - debugging
  - feeling like it was possible for me to create a fully working application; while I would've liked to have spent more time on the styling and other visual features of the application, I'm pleased with the functionality of the application thus far
